

NEW LINE OF CHIPPERS FOR THE PRODUCTION  
OF HIGH QUALITY CHIPS, SUITABLE TO HANDLING  
LARGE QUANTITIES OF MATERIAL

**CHIPPERENERGY**

The ENERGY range consists of a range of medium-large sized drum chippers developed for the production of high quality chips. These machines are suitable to handle large amounts of material of any size and type. Complete with electronic NOSTRESS system and gauging grid, they may be supplied with set-ups to address any need.

CHIPPERENERGY  
23 | 30 | 40 | 50 | 80

Thanks to very aggressive drive rollers, feeding is always perfect with any kind of material. The machine's conveyors in the lower part of the rollers assure recovery of any escaped chips.

The feeding chute may be fitted with steel chains (optional).

All Energy chipper models may be set up with wheels for towing, own engine or placed on self-propelled vehicles. The drum cutting system with multi-blades assures production of high quality chips (calibration grate). The ejection of the chips with a multiblade fan makes it possible to obtain dust-free chips and loading even a 40' container, with minimum power absorption. The 360° rotating discharge pipe is adjustable in height and hydraulically tilting.

Range of professional medium-sized chippers with drum cutting system. Designed to obtain high-quality, consistent and well-calibrated chips, for use for energy purposes in boilers of any make and size, to produce pellets, or for industrial production of chipboard panels.

**NEW LINE OF CHIPPERS FOR THE PRODUCTION OF HIGH QUALITY CHIPS, SUITABLE TO HANDLING LARGE QUANTITIES OF MATERIAL**

The innovative technical solutions applied, allow the Energy range to be used in especially heavy-duty and continuous work that may range from forestry to chipping sawmill waste and maintenance of large parks. Any wood material may be ground, logs, branches, twigs, green prunings including resinous trees or palm residues, as well as particularly hard wood. Innovative system for extracting chips: the chips are instantly extracted by the chipping drum through a vacuum system that makes it possible to remove all intermediate parts such as worm screws etc. This results in a reduction of absorbed power, reduction in dust in the chips, longer service life of the blades, reduction in maintenance costs as well as elimination of all chipper clogging issues. Clogging is eliminated: green and moist material may be chipped with optimal results with no clogging issues.

Gear motors very powerful

Hydraulic system

The wide loading hopper, complete with large sized drive rollers driven by gear motors and steel drive chains (optional) assure perfectly feeding the chipper with any type of material. The hopper may be folded for transport.

**Version TPS-TTS** professional chipper, driven by the tractor's PTO at 1000/750 RPM. Carried on the three tractor points. With wheels and drawbar for towing (optional).

**Version MTS-MTE** forestry chipper, driven by independent engine with water cooled diesel engine option, or with electric motor. Motion transmission by V-belts. With road trailer approved for towing at 80 or 40 km/h (optional). Self-propelled crawler mounted outfitting (optional).

#### FEATURES

- Double hydraulic drive rollers with very powerful gear motors.
- Solenoid valve block.
- All electronic controls.
- Safety and control system with galvanised panic bar.
- Drum with adjustable exposure blades.
- High thickness steel chipping drum.

CHIPPERENERGY 23 | 30 | 40

Great throwing power

CT 30/60 perfect chipping on vine trimmings

- Quick blade attach-detach system.
- Gauging grid.
- Joystick to control input or ejection of the material.
- Chip ejection cap with adjustable tilt.
- Hydraulic pump mounted with flexible coupling system to increase service life.
- Hydraulic pump with cast iron flanges to increase service durability over time.
- Hydraulic system independent from the tractor.
- Pressurised oil tank to assure perfect cleanliness of the oil hydraulic system.
- Hydraulic oil filter on intake.
- Oversized, maintenance-free chipping disc supports.
- Bearing with double row of barrel rollers.
- Shaft fitting in hardened 38NCD4.
- Folding loading hopper to reduce overall dimensions during transport or storage.
- Easy access for maintenance.
- Lifting hook.
- Folding pipe with gas piston lowering system (optional).
- Roller revolutions adjustment valve (optional).
- The chipper may be fitted with hydraulic log loading crane (optional).
- Centralised greasing (optional).

## CHIPPERENERGY 40 | 50 | 80

NEW LINE OF CHIPPERS FOR THE PRODUCTION OF HIGH QUALITY CHIPS, SUITABLE TO HANDLING LARGE QUANTITIES OF MATERIAL

Intended for use in medium to large sized forest sites, this chipper ensures high productivity. Designed to be used in forestry, the **ENERGY 40-50-60** range has been developed to produce high quality chips to be used in the energy sector.

ENERGY drum chippers have been designed around a drum blade cutting system, while all operations carried out by the machine to produce chips may be automatically controlled with an electronic system.

The machines are fitted with the most innovative NOSTRESS and NOBLOCK systems and, thanks to their technical structure, they may be driven by tractor or independent engine.

CT 40/75TTS

To increase chip production and fully exploit the power output, these chippers are equipped with a series of high grip toothed rollers, which may be added by an industrial chain conveyor for conveying into the chipper even significant amounts of medium-large sized twigs. Furthermore, all models are fitted with an output calibration grid to produce various chip sizes. The main intended use for this range of chippers is the medium-large sized forestry site, although they may also be applied in agriculture.

Control and instrumentation panel on the machine

**The chipping block** is made with very thick steel plates that assure long durability even under heavy duty and continuous operating conditions.

**The steel plates subject to greater wear**, such as the fan case panel, the drum case panel, the chip ejection pipe outer sheet metal are in wear-proof HARDOX600 steel. The ejection fan consists of interchangeable screwed terminals.

CT 40/75 TTG

CT 40/75 TTS

The **large-sized chipping** drum processes to perfection even large-sized logs. It consists of two rows of five blades, easily replaceable for sharpening operations. The blade is fastened to the drum with steel screws. The screws are screwed into interchangeable threaded and cemented bushes placed on the support plate of the blades.

The **blades** and the counterblade are both adjustable and allow chip size to be changed with utter precision.

The calibration grid is interchangeable, disassembly is easy and quick.

**Chip size adjustment** is carried out by changing the exposure of the blades and replacing the calibration grid. By adjusting the distance between blade and counterblade, chips of the desired size may be obtained even before the chips come into contact with the grid. This markedly reduces dust and the "regurgitation" effect (chips that go back into the chute), thus assuring lower power absorption, lower blade wear, higher productivity and very high quality chips.

The **bearings of the chipping drum** are of the type with double row of barrel rollers and oversized, contained in steel supports CNC machined from billet with large support flange to ensure strong stability.

CT 40/75 TTS

CT 40/75 TTS

Four toothed rollers and powerful and indestructible supply chain

CT 50/75 TTS

The **chip ejection fan**, with suction effect, is in direct contact with the chipping drum. This makes it possible for the chips to be immediately extracted after chipping, leading to a marked decrease in power consumption and dust. In fact the absence of middle components, such as worm screws, assures the chips maintain their speed. This makes it possible for the fan to turn at a lower speed, thus also reducing the wear of the sliding plates. The simplicity of the ejection system completely eliminates any clogging problem even when grinding green twigs or material with leaves.

The **chip ejection pipe** revolves at 360°, it is fitted in the end part with a baffle to convey the chips with precision into containers of any height. Foldable into the shape limits for road transport.

The **feeding hopper** is constructed with steel plate, reinforced on the perimeter and on the sides. It consists of a large sized tank with containing sides and toothed feeding rollers. The end part of the hopper folds hydraulically to reduce overall dimensions during transport.

CT 50/100 TTG

CT 50/100 TTG

The **horizontal toothed drive rollers** (three plus four additional ones as optional) are driven by oversized oil bath planetary gear motors. This assures great drive strength, that makes it possible to handle large amounts of material, large-diameter logs or with bifurcations, twigs and branches etc.

The **supplementary drive rollers** (four as optional), located in the feeding hopper, have the purpose of aiding in the introduction of especially bulky material. Furthermore, they help eliminating any foreign matter in the twigs and logs to be ground (e.g. soil, stones etc.).

**Greasing of all points is centralised** to reduce maintenance and make operations easier.

The **hydraulic system** actuates all the chipper's operations. The circuit consists of FOUR hydraulic cast iron pumps and FIVE blocks of solenoid valves that individually supply the three toothed traction rollers and other services such as pipe rotation for chips output, mobile roller motion etc.

Remote control for MTS version

CT 80/130 MTS

**Powerful planetary gear motors** in oil bath assure rotation of the toothed rollers. The circuits are at low pressure and filtered to assure proper operation with no circuit overheating. This leads to long durability of the system and consistent operation over time. All operating pressures are easily controlled on the control monitor on the machine.

**The electric system integrated with the machine's computer** controls the whole machine in every work stage. Thanks to a touch-screen monitor the operator interface is simple and user-friendly, making it possible to perform any operation and monitoring status of the work stages. Any required maintenance or fault is also signalled.

**The NOSTRESS device**, which controls the grinding stage, interrupts feeding the material when the engine's speed is excessively low and resumes automatically as soon as the engine's power picks up again.

The **NOBLOCK** device assures the material is fed smoothly by triggering in the event of accidental block of the feeding components (chain and roller).

The **engine and transmission** (MTS version) consist of a diesel engine with water cooling and oversized radiator. Thanks to pneumatic fan inversion the radiator may always be kept clean, thus increasing performance. The power transmission of the engine is by means of belts with hydraulic engage.

The user controls the engine with a digital panel. Data transmission uses the Can-BUS system

**Remote control** (wireless in radio frequency, optional): it controls all the machine's operations. Tested against impact and suitable for humid environments. Active and passive safety category 4 (UNI EN 954-1)

**Hydraulic loading crane** (optional): the chipper may be fitted with hydraulic log loading crane, set up as desired by the customer.

The ENERGY range may also be configured for applications on crawler or wheeled self-propelled vehicles, on demountable vehicles, towed and approved for road use, with chipper head placed on a rotating platform, complete with hydraulic log splitter to reduce the size of the outside logs.
